SOLUTION PITCH / GREAT INDIAN AI INTERNSHIP CHALLENGE

Katha Studio

Your imagination. A full cast. One studio.

THE PROBLEM

Turning a story into an engaging audio drama is often fragmented. Creators may need to write or adapt a script, find voice artists, record each character, edit dialogue, and assemble the final audio using separate tools. This can make production time-consuming and difficult for independent creators, particularly when creating stories in Indian languages.

THE SOLUTION

Katha Studio is an oral-first, multilingual AI audio-drama production workspace that brings the core story-to-audio workflow into one place. Creators can type or narrate a story, turn it into a structured screenplay, cast distinct AI voices for characters, generate dialogue audio, arrange the output, and export a finished WAV file.

HOW IT WORKS

1. Create	Write, upload, or narrate a story in a supported language.
2. Transcribe	Gnani Prisma v2.5 converts spoken narration into text.
3. Structure	Groq transforms the story into screenplay JSON with scenes, characters, and dialogue.
4. Cast & generate	Choose voices from the Voice Library, assign them to characters, and generate speech with Gnani Timbre v2.5.
5. Compose & export	Preview and regenerate dialogue lines, combine audio in the browser, and download the final WAV production.

TECHNOLOGY

React 19 · TypeScript · TanStack Start · Groq · Gnani Prisma v2.5 (speech-to-text) · Gnani Timbre v2.5 (text-to-speech) · Web Audio API · LocalStorage · IndexedDB

WHY IT MATTERS

Katha Studio reduces the friction between having a story idea and producing a listenable audio experience. It gives creators one guided workflow for screenplay structuring, character voice selection, dialogue generation, and audio assembly—with a focus on making multilingual audio storytelling more accessible.
